

Role: Embedded Systems Engineer

Summary: Build and validate embedded control firmware and digital logic for industrial products.

#### Required Skills

- C/C++ or Python
- Verilog or SystemVerilog / RTL fundamentals
- Debugging and test-driven engineering
- Linux and Git

#### Preferred Skills

- MATLAB or LTspice
- CI/CD and observability tooling

#### Responsibilities

- Design and validate digital control logic.
- Diagnose system failures using structured experiments.
- Collaborate with firmware, hardware, and test engineers.
- Document trade-offs and verification evidence.

#### Constraints

- Must contribute independently within the first 90 days.
- Role requires evidence of hands-on design depth.
